

partnering with our customers to create innovative solutions

Every software application, ranging from HR Tracking, to Financial Accounting, to Inventory Control, has its own unique requirements and vocabulary. Exago is dedicated to insuring that eWebReports seamlessly integrates with your application. We don't ask you to work around our product limitations so your clients don't have to work around yours.

eWebReports Solves Elusive Reporting Problems

- Seamless Integration with Your Existing Applications
- Multiple Many-to-One Relationships
- Charting & Graphing
- Linked Reports & Drilldowns
- Automated Report Scheduling

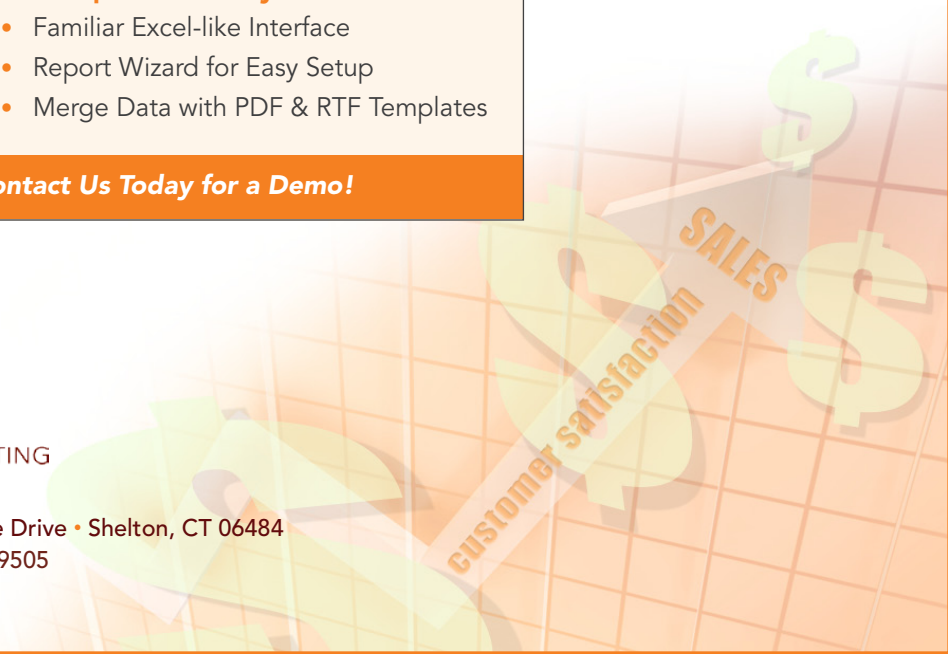

eWebReports is Easy to Use

- Familiar Excel-like Interface
- Report Wizard for Easy Setup
- Merge Data with PDF & RTF Templates

Mobile Device Support

Mobile support is often accomplished with expensive custom applications. eWebReports allows mobile device access using a 100% browser-based interface, which requires no special integration, application download or training.

Solving the Dreaded "Multiple One-to-Many" Dilemma

Traditional report writer products do not allow end users to create a single report containing multiple one-to-many relationships. (Example: a report that required a detailed listing by store, of revenue by each kitchen appliance sold and revenue by each hardware item sold, with subtotals by kitchen appliances and subtotals by hardware.) Rather than having to go thru the complicated process of creating and linking sub reports, eWebReports allows the end user to design one comprehensive report.

Familiar Excel-Like Interface

When asked about the required functionality for an Ad Hoc reporting solution, almost all users rank the ability to create Excel output files high on the list. eWebReports outputs fully formatted Excel workbooks (not just CSV files), and allows users to design the format in an Excel-like grid. This eliminates the "guess work" in placing data in the correct cells.

Charting & Graphing

The charting and graphing features in eWebReports allows the delivery of quality visual presentations with the click of a few buttons. Multiple charts and graphs can be combined on a single report giving users a comprehensive overview of important data.

Merge Data with PDF & RTF Templates

eWebReports provides the ability to design a report and associate a field on the design screen with a PDF form field. When the report is executed, the qualifying data is merged into the PDF form.

Multi-level Access and Flexible Security

eWebReports offers numerous levels of access from full administration to read-only users. In addition, its security is flexible enough so that it can adapt to virtually any unique security environment. When fully integrated into your application, eWebReports can also be easily set up to work with your own application's login.

Linked Reports & Drilldowns

eWebReports allows for an unlimited number of reports to be linked to each other. You simply click on the appropriate field and eWebReports returns data from the linked report and allows concurrent windows to be displayed at once.

New Report Wizard

The primary goal of eWebReports is to allow not only "power users", but even the "casual user", to easily design and execute reports. The New Report Wizard is designed to walk users thru all of the required steps in creating a new report, from designing the layout, to selecting filters and sort sequencers, to selecting the output mode (e.g.: Excel, HTML, PDF, RTF).

Automated Report Scheduler

Many reports are required to be run at set intervals. eWebReports allows users to schedule reports to be run at a predetermined time without any manual intervention.
